Artificial Intelligence (AI)

AGENDA

- Theory of Convolutional neural network
- Implementation of CNN (Practical)

Convolutional Neural Network

- A deep neural network commonly used in image and video recognition and processing.
- CNN consists of several layers
  - Convolutional Layer
  - Pooling Layer
  - Fully Connected Layer

Convolutional Neural Network

- **Convolutional Layer:** This layer applies a set of filters to the input image to extract features such as edges, corners, and blobs. The filters are learned through the training process
- **Pooling Layer:** After the convolutional layer, a pooling layer is typically added. This layer reduces the spatial dimensions of the output from the convolutional layer, which reduces the number of parameters in the network and helps prevent overfitting**.**
- **Fully Connected Layer:** The final layer in a CNN is typically a fully connected layer, which computes the output classification score based on the features learned in the previous layers.
